

## Additional notes for an installation under Windows Vista and Windows 7

If a TAP program is meant to be used under Windows Vista/7 within an **administrative account** it is necessary to perform a "Run as administrator".

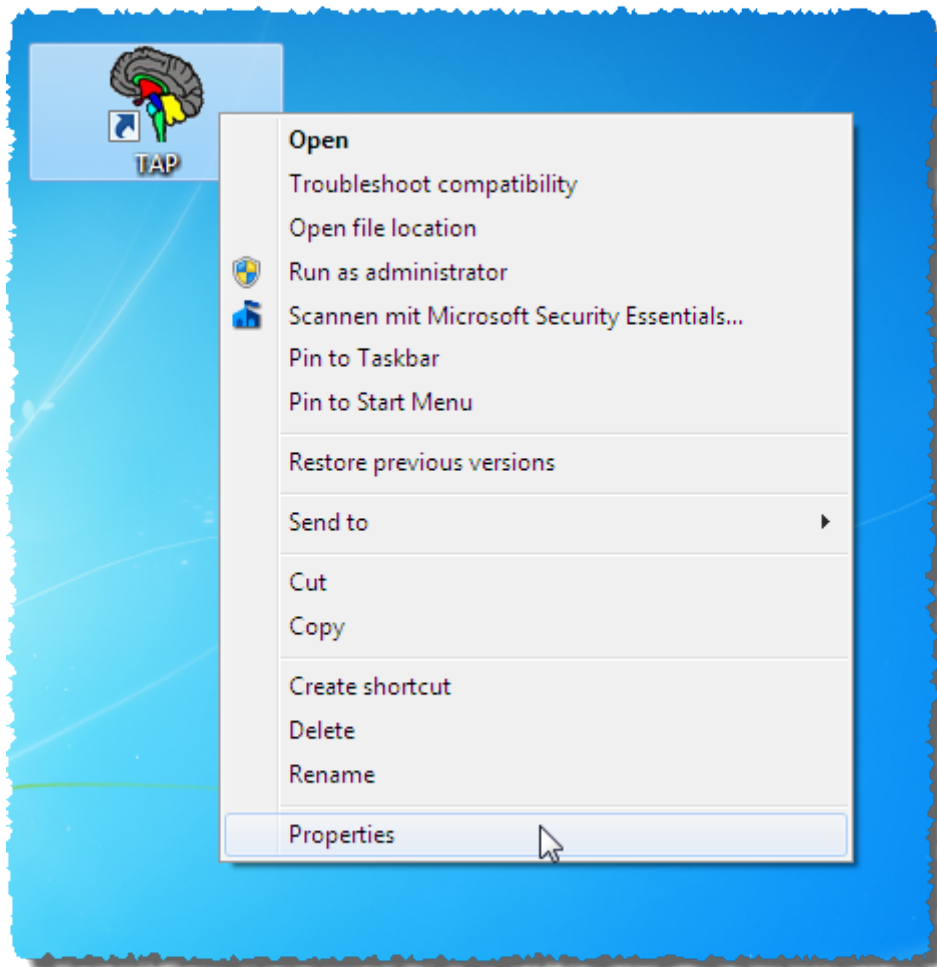

The reason for that is the so called user account control feature introduced with Windows Vista, which presents an additional confirmation dialog for every action which needs administrative privileges.

To add the administrative account to the TAP doesn't help unfortunately, because the additional rights aren't respected in that case – in contrast to a normal user account with limited rights.

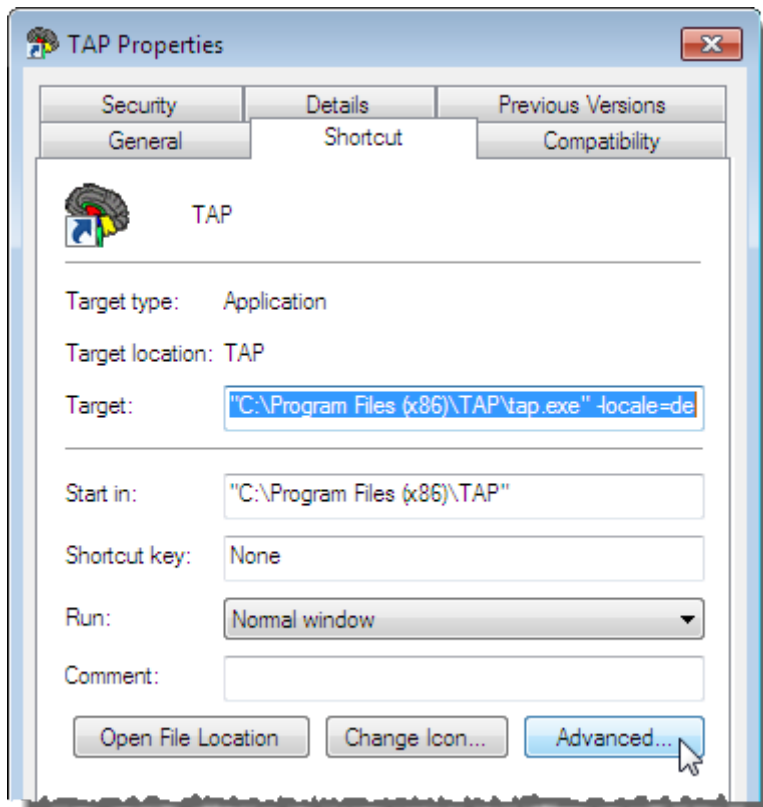

Running a TAP program with administrative rights can be done via the desktop shortcut performing a right click:

To make the setting permanent first choose "Properties" from the former context menu:

In the following dialog on the tab "Shortcut" choose "Advanced":

In the additionally opening dialog activate the option "Run as administrator" and finally close all dialogs with "OK":
